

ABSTRACT OF THE DISCLOSURE

A service discovery mechanism may allow clients in a distributed computing environment to search for services. The service discovery mechanism may allow a client
5 to request a capability credential from a service. In one embodiment, the client may present to the service a set of desired capabilities. The service may then respond with a capability credential that may convey to the client the rights to use the requested capabilities. A complete service advertisement may be needed to create a message endpoint for accessing the service. In an embodiment, the capability credential may be
10 used by a client to obtain a complete advertisement for the requested capabilities. The capability credential may provide an additional level of security for the service provider. The capability credential that may be used to receive the complete advertisement may also be used to construct a message gate to communicate with the service where the gate embeds the capability credential in each message to the service.
